

Cherry Hill Estate Site Services

Options for Electrical Services:

- A. 30 amps 120 volts - run's in a separate wire
20 amps 120 volts - run's in a separate wire**

When you run power at 120 volts it is not a balanced load. So when you plug in a frying pan and air conditioner and they both call for power at the same time, your breaker goes.

If you would like more power than 30 amps, a separate plug-in with 20 amps, located just under your 30 amps service is \$125/Season. This does not mean a 50 amps service. This just means that you can use the 20 amps 120 volts service as well. Most people just plug in an extra fridge or some lights so the extra cost of power is low compared to fully balanced power stream at 50 amps 240 volts, as explained in B.

Existing 30 amps 120 volts service	Included in site fee
Separate additional 20 amps 120 volts service	\$125/Season

B. 50 amps 240 volts

A 50 amps 240 volts service combines the two wires into a balanced load, which is the same kind of power that comes into your house. A lot of homes only have a 100 amps 240 volts service. The trailers that are set up with 50 amps prefer the 240 volts. In these units you can add a dryer and washer or other large appliances.

We do not have metered sites. Therefore we have set the fees at a \$200.00 onetime fee at cost to change from 30 amps 120 volts to 50 amps 240 volts, with a \$300.00 increase per year on your annual site fee. All 50 amps 240 volts services pay the same.

Change existing 30 amps 120 volts service to 50 amps 240 volts	\$200 onetime fee
50 amps 240 volts service	\$300/Season

Moving services to the opposite side of the site:

The procedure to change your services to the opposite side of your site is as follows:

First we change the sewer on the opposite side to accept two units. Then we put in a 4' pipe across the lot for you to run your electrical cable and water hose. We repair the site with fresh crusher dust wherever is needed.

Moving service fee	\$500 onetime fee
